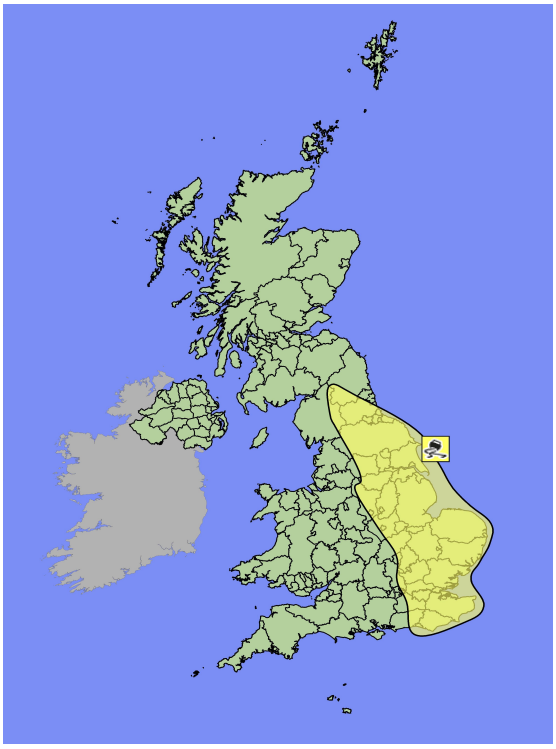
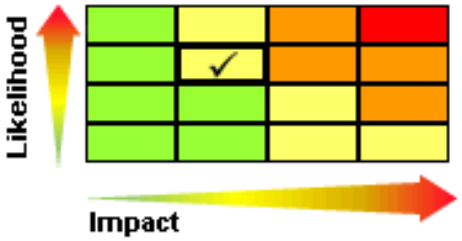
National Severe Weather Warning Service





Chief Forecasters Assessment
There are a number of reasons that ice is likely to be a hazard during Monday evening and overnight into Tuesday across the more eastern parts of England. These include, snowfall from the weekend persisting on some untreated surfaces, whilst snow that melts during the afternoon will freeze on untreated surfaces overnight. There is also a risk of showers affecting parts of eastern England this evening, which will then extend southwest into parts of southeast England and possibly the East Midlands overnight. The showers will fall as a mixture of rain, sleet and snow, with the possibility of 1-3 cm of snow accumulating in places - mainly East Anglia. Freezing fog will also increase the risk of ice over northern England. Icy patches are also possible on untreated surfaces across other parts of England, Wales and Scotland, but to a lesser extent than in the highlighted area.

The Met Office have issued a **Yellow Warning** of **Ice**

Valid from **16:00 on Mon, 06th Feb 2012** until **11:00 on Tue, 07th Feb 2012**

Ice is likely to form on untreated roads and pavements across many parts of northern, central and eastern England. Wintry showers will also affect eastern and southeastern England overnight and into Tuesday morning leading to some further slight accumulations of snow in places, whilst freezing fog patches will be an additional hazard across northern England. The public should be aware of the risk of disruption to travel.
